

Quaternary Fault and Fold Database of the United States

As of January 12, 2017, the USGS maintains a limited number of metadata fields that characterize the Quaternary faults and folds of the United States. For the most up-to-date information, please refer to the [interactive fault map](#).

unnamed syncline west of Carbondale (Class B) No. 2335

Last Review Date: 1998-09-16

Compiled in cooperation with the Colorado Geological Survey

citation for this record: Widmann, B.L., compiler, 1998, Fault number 2335, unnamed syncline west of Carbondale, in Quaternary fault and fold database of the United States: U.S. Geological Survey website, <https://earthquakes.usgs.gov/hazards/qfaults>, accessed 12/14/2020 03:00 PM.

Synopsis

This unnamed, east-northeast-trending synclinal sag lies within the Carbondale collapse center east of the Grand Hogback monocline. The sag is interpreted to result from flowage and dissolution of evaporite from beneath the area. Undivided Pleistocene "older " alluvium and colluvium are deformed by this structure (Kirkham and Widmann, 1997 #2711). There have not been any detailed studies conducted on this structure. In as much as the faulting may be aseismic (salt related), we considered this to be Class B structure.

|----------------------------------|--|
| Name comments | <p>Unnamed synclinal fold west of Carbondale of Widmann and others (1998 #3441), herein shorted to "unnamed syncline west of Carbondale. This unnamed structure is an east-northeast-trending synclinal sag west of Carbondale near Edgerton Creek. The sag lies within the Carbondale collapse center (Kirkham, 1997 #2705; Kirkham and Widmann, 1997 #2711) and is related to flowage and dissolution of evaporite from beneath the area.</p> <p>Fault ID: Fold # Qf6 of Widmann and others (1998 #3441).</p> |
| County(s) and State(s) | GARFIELD COUNTY, COLORADO |
| Physiographic province(s) | SOUTHERN ROCKY MOUNTAINS |
| Reliability of location | <p>Good Compiled at 1:250,000 scale.</p> <p><i>Comments:</i> This synclinal sag was mapped at a scale of 1:24,000 by Kirkham and Widmann (1997 #2711).</p> |
| Geologic setting | This unnamed, east-northeast-trending synclinal sag lies within the Carbondale collapse center, which is reported to have experienced significant Neogene collapse due to flowage and dissolution of evaporite deposits from beneath the area (Kirkham and Widmann, 1997#2711). The area is underlain by at least 900 m of evaporite deposits (Mallory, 1966 #2720). |
| Length (km) | 1 km. |
| Average strike | N70°E |
| Sense of movement | <p>Syncline</p> <p><i>Comments:</i> Syncline trends north-northeast; limbs dip roughly to the south and north.</p> |
| Dip Direction | N; S |
| Paleoseismology studies | |
| Geomorphic expression | This feature is a synclinal sag developed in Pleistocene deposits (Kirkham and Widmann, 1997 #2711). |
| Age of faulted | |

| | |
|--|--|
| Age of related surficial deposits | Pleistocene "older" alluvium and colluvium are deformed by this synclinal sag (Kirkham and Widmann, 1997 #2711). |
| Historic earthquake | |
| Most recent prehistoric deformation | undifferentiated Quaternary (<1.6 Ma) <i>Comments:</i> Pleistocene "older" alluvium and colluvium are deformed by this synclinal sag (Kirkham and Widmann, 1997 #2711). |
| Recurrence interval | |
| Slip-rate category | Less than 0.2 mm/yr <i>Comments:</i> Widmann and others (1998 #3441) placed this anticline within the <0.2 mm/yr uplift-rate category. |
| Date and Compiler(s) | 1998 Beth L. Widmann, Colorado Geological Survey |
